

Multiple golf courses across the United States tested an 8 oz application of Worm Power Liquid Extract (WPLE) applied bi-weekly on turf. The WPLE was an addition to their current management programs. Root plugs were taken, and the roots were evaluated by comparing the addition of WPLE to the current program.

Root plug length comparisons (above) of WPLE to an untreated control (CTRL). On average, a bi-weekly 8 oz application increased root length **27.9%** on greens and **34.1%** on fairways.

Root comparison (above left) of bermudagrass fairway control and 8 bi-weekly applications of 8 oz of WPLE.

A fall trial (above right) evaluated 16 oz of WPLE monthly to an area of fairway for thatch reduction. Eight days after application, differences in thatch were observed and noted 16 oz monthly was effective for thatch reduction.

Trials have shown that Worm Power Liquid Extract can increase root length and reduce thatching in turf grass. Better root systems allow for enhanced water usage and provide plants with a healthier foundation. Worm Power Liquid Extract (WPLE) has 1,400 different microbes in suspension that provides the roots a diverse population for obtaining nutrients.
